February 25, 2026

We invite your perspective on responsible and durable AI governance. As AI systems grow in capability and autonomy, principled oversight is urgent. There is no prescribed format; we welcome rigorous, independent viewpoints across ethics, policy, technology, law, and institutional design.

You may choose to address themes such as:

- **The Architecture of AI Governance**

Should oversight frameworks be national, multilateral, industry-led, state-led, or hybrid? Which structural model is most resilient over time?

- **Ethical Non-Negotiables**

Which principles must remain inviolable as AI systems scale in autonomy and influence? Where do prevailing frameworks fail to anticipate emerging risks?

- **Accountability & Liability Structures**

How should responsibility be distributed across developers, deployers, institutions, and end-users when harm occurs?

- **Persistent Memory, Agency & Autonomy**

As systems develop long-term memory and increasingly agentic behavior, what technical and policy guardrails become essential?

- **Near-Term Actions vs. Structural Reform**

What must be addressed within the next 3–5 years? What deeper institutional redesign is required over the next decade?

We look forward to your considered insights and contribution to shaping durable AI governance.

Warm regards,

Arsalan
